

Structural Self-Energy Expansion (SSEE-V3.6)

A zero-free-parameter dark energy model from φ and π

Seeking arXiv endorsement in astro-ph.CO (or gr-qc)

Core idea in one sentence

The core cosmological background — $w_0, w_a, H_0, \Omega_m, n_s$ — is derived *algebraically* from the golden ratio $\varphi = (1 + \sqrt{5})/2$ and π with **zero free parameters**. Perturbation variables (α_K, m_φ) are formulated as a working EFT proposal subject to full Boltzmann validation.

Key algebraic predictions

Quantity	SSEE algebraic value	Observed / constraint	Agreement
w_0	$-T_r/M_v = -0.8400$	DESI DR2: -0.838 ± 0.057	0.05σ
w_a	$-P_{sc}/K_v = -0.6699$	DESI DR2: -0.631 ± 0.226	0.17σ
H_0	$3(\varphi + \pi)^2 = 67.96 \text{ km/s/Mpc}$	Planck 2018: 67.36 ± 0.54	1.11σ
r_d	CAMB+MIRA: 147.2 Mpc	Planck 2018: $147.09 \pm 0.26 \text{ Mpc}$	0.25σ
H_0^{local}	$H_0^{\text{alg}}/(1 - f_{\text{scr}}) = 72.86 \text{ km/s/Mpc}$	SH0ES 2022: 73.04 ± 1.04	0.17σ
n_s	$1 - \varphi^{-7} = 0.9656$	Planck PR4: 0.9649 ± 0.0042	0.17σ
r	$\varphi^{-10} = 0.00813$	BK18: $r < 0.036$	Prediction
$\alpha_K(0)$	$3\Omega_{\text{DE}}(1 + w_\phi) = 0.073$	Euclid forecast sensitivity	< 0.1
m_φ	$\Sigma m_\nu \cdot H_0^{\text{alg}} = 5.71 \text{ eV}$	KATRIN/PTOLEMY (2027–30)	Prediction
k_{fs}	0.493 h/Mpc	DESI Y3/Euclid (2026–28)	Prediction

Ten-paper series (all reproducible)

I. Derived Algebraic Background

- **Paper 1 (Framework)**: Algebraic derivation of geometric constants; α -attractor embedding ($\alpha = \varphi^4/3$). [22 pp]
- **Paper 4 (Nine Sovereignities)**: CMB observables ($\ell_1, \ell_2, \ell_3, \theta_*, A_s, n_s, \tau, r$) bounded algebraically. [15 pp]

II. Tested Against Data

- **Paper 2 (MCMC)**: 100 walkers $\times$ 25 000 steps vs. DESI DR2 + Planck + 7 clusters; $\Delta\text{BIC} = -5.55$ (SSEE favoured, $k_{\text{SSEE}} = 1$ vs. $k_{\Lambda\text{CDM}} = 3$, dynamic sector). [21 pp]
- **Paper 3 (CMB Confrontation)**: CAMB + MIRA two-sector mapping; Cobaya+plik_lite MCMC; $\Delta\text{BIC} = -31.3$ (SSEE favoured under $k = 2$ model comparison). [18 pp]

III. Phenomenological Extensions & Open Directions

- **Paper 5 (Israel–Stewart Perturbations)**: Causal bulk viscosity; $c_s^2 = 0$ exact; $\gamma_{\text{IS}} = 0.554 \approx \gamma_{\Lambda\text{CDM}}$. [24 pp]
- **Paper 6 (φ -DM Two-Sector)**: $m_\varphi = 5.71 \text{ eV}$ defined as a phenomenological mass scale; proposes a two-sector reduction of the $f\sigma_8$ tension to 0.50σ at the linear-growth level. [16 pp]
- **Paper 7 (Canonical EFT Proposal)**: $\beta_c = -\text{AURA}$ (numerical -3.998); $\alpha_K = 0.073$ algebraic; fundamental parameters λ, V_0, M proposed. [14 pp]

IV. Strong-Field Regime, Hubble Tension & UV Completion

- **Paper 8 (Strong Gravity):** Disformal null geodesic; photon deflection amplified by $\sqrt{\Lambda_{\text{URA}}} \approx \mathcal{M}$; k -mouflage screening satisfies solar-system tests; two-sector strong-lensing prediction. [16 pp]
- **Paper 9 (Hubble Tension):** Algebraic local screening fraction $f_{\text{scr}} = (\pi - \varphi)/(\varphi + \pi)^2 \approx 0.067$ gives $H_0^{\text{local}} = 72.86 \text{ km/s/Mpc}$, 0.17σ from SH0ES, zero free parameters. [18 pp]
- **Paper 10 (UV Completion):** Higher-derivative operator $K(X) = X/\text{KAL}_0 + X^2/M^4$ with algebraic cutoff $M = 8.81 \text{ meV}$; connects the dark-energy EFT to the inflationary α -attractor. [14 pp]

Falsifiability (explicit)

- $m_\varphi = 5.71 \text{ eV}$ — KATRIN (2027) or PTOLEMY (2030) will confirm or refute.
- $k_{\text{fs}} = 0.493 \text{ h/Mpc}$ — DESI Y3 + Euclid lensing will confirm or refute.
- $\alpha_K \approx 0.073$ — Euclid weak lensing will probe this kineticity limit.
- $r = \varphi^{-10} = 0.00813$ — LiteBIRD (~ 2032) will confirm or refute the tensor-to-scalar ratio.
- A $> 3\sigma$ deviation of w_0 from -0.840 would falsify the corresponding background sector of the framework.

What I am asking for

An arXiv endorsement in `astro-ph.CO` (or `gr-qc`) to submit Papers 1–3 as the first tranche. All code, data, and L^AT_EX sources are public at github.com/mikealmeida1721/SSEE under Apache-2.0.

I am happy to answer any technical questions or share the PDFs directly. Thank you for considering this request.

Code: Python (emcee, CAMB, CLASS), all reproducible in <30 min. **Data:** DESI DR2 (public), Planck PR4 (public), KiDS-1000 (public).
